That means you've got access to an entire library of classic literature that you can read on the computer or on a variety of mobile devices and eBook readers.

Early Appearance Of Rabies Virus

Rabies is a viral disease that causes inflammation of the brain in humans and other mammals. Early symptoms can include fever and tingling at the site of exposure. These symptoms are followed by one or more of the following symptoms: violent movements, uncontrolled excitement, fear of water, an inability to move parts of the body, confusion, and loss of consciousness.

Rabies - Wikipedia

After a bite or other rabies exposure, the rabies virus has to travel through the body to the brain before it can cause symptoms. This time between the exposure and the appearance of symptoms is called the incubation period, and it may last for weeks to months. The incubation period may vary based on the location of the exposure site (how far away it is from the brain), the type of rabies ...

What are the signs and symptoms of rabies? | Symptoms | CDC

Rabies virus from the infected saliva enters the wound. Rabies virus travels through the nerves to the spinal cord and brain. This process can last approximately 3 to 12 weeks. The animal has no signs of illness during this time. When it reaches the brain, the virus multiplies rapidly and passes to the salivary glands.

The Path of the Rabies Virus | Transmission | CDC
