Six steps to pump sizing. In order to size a pump, engineers need to estimate the temperature, density, viscosity and vapor pressure of the fluid being pumped. Pump sizing can be accomplished in six steps, as follows: Find the total dynamic head, which is a function of the four key components of a pumping system, such as the one shown in Figure 1

Centrifugal pump performance capacity can be calculated in the following way: $Q = b \cdot 1 \cdot (\pi \cdot D \cdot 1 - 6 \cdot Z) \cdot c \cdot 1 = b \cdot 2 \cdot (\pi \cdot D \cdot 2 - 6 \cdot Z) \cdot c \cdot 2$. Q - centrifugal pump performance capacity, m³/s. b 1,2 - widths of impeller pass through diameters D 1 and D 2, m. D 1,2 - inlet external diameter (1) and impeller external diameter (2), m.
