Inductors are components that are simple in their construction, consisting of coils of insulated copper wire wound around a former that will have some type of core at its centre. This core might be a metal such as iron that can be easily magnetised, or in high frequency inductors, it will more likely to be just air.

A seminal reference for inductance calculation (which, unfortunately is now out of print) is the Frederick Grover book. Professor Grover spent most of his professional life calculating inductance of different kinds of wire loops, and many useful examples and tables are given for loops of interesting shapes and sizes.
