Biology Guide Human Chromosomes

Chromosomes. Chromosomes are genetic structures found in cells during cell division. A chromosome is made from tightly packed strands of DNA and a huge number of proteins called histones. True chromosomes are found only in eukaryotic cells. Prokaryotic cells contain much less DNA which is packaged with proteins but not into 'true' chromosomes.

Chromosomes are the form of the genetic material of a cell during cell division. See the "Chromosomes" section for additional information. The human genome has 23 pairs of chromosomes located in the nucleus of somatic cells. Each chromosome is composed of genes and other DNA wound around histones (proteins) into a tightly coiled molecule.

Chromosomes are the form of the genetic material of a cell during cell division. It is this coiled structure that ensures proper segregation of the chromosomes during cell division. During other phases of the cell cycle, DNA is not coiled into chromosomes. Instead, it exists as a grainy material called chromatin.

Human X chromosome completely sequenced for the first time

The normal chromosome complement of a human cell is 23 pairs of chromosomes. Of these, 22 pairs are autosomes, which contain genes for characteristics unrelated to sex. The other pair consists of sex chromosomes (XX in females, XY in males). Only the Y chromosome contains genes that determine sex. Humans have an estimated 20,000 to 22,000 genes.
