### (PDF) Derivation of Boltzmann Principle

We derive the Boltzmann principle  $S = k_B \ln W$  based on classical mechanical models of thermodynamics. The argument is based on the heat theorem and can be traced back to the second half of the 19th century in the works of Helmholtz and Boltzmann. Despite its simplicity, this argument has remained almost unknown.

Stefan Boltzmann Law relates the temperature of the blackbody to the amount of the power it emits per unit area. The law states that: "The total energy emitted/radiated per unit surface area of a blackbody across all wavelengths per unit time is directly proportional to the fourth power of the black body's thermodynamic temperature.

In thermal equilibrium, the emitted and absorbed radiation energy is the same, so that in principle a gas of photons is formed in the cavity. Instead of massive particles, in this case we are dealing with massless, relativistic photons. Here, ...

We derive Boltzmann's principle from classical mechanics with one simple guiding principle, viz., the heat theorem (see Statement 1, below), and one central assumption, namely, the ergodic hypothesis. In Sec. II we briefly review basics of thermodynam- ics.

We present a derivation of Boltzmann principle based on classical mechanical models of thermodynamics. The argument is based on the heat theorem and can be traced back to the second half of the nineteenth century with the works of Helmholtz and Boltzmann. Despite its simplicity, this argument has remained almost unknown.

### Derivation of the Boltzmann Distribution

Boltzmann distribution derivation But we know that  $\Omega = \Omega_A \Omega_B - \Omega_{AB}$ , so it depends on the energy in A, so rewrite  $\Omega_A = \exp \left( \frac{E_A}{k_B T} \right) \Omega_{A,0}$  Thus the # of states in B depends on what state A is in.

Using a classical mechanical model of thermodynamics, we derive Boltzmann's Principle for the entropy  $S < \text{SUB} > B < / \text{SUB} > = k < \text{SUB} > B < / \text{SUB} > \ln W$ , where  $k < \text{SUB} > B < / \text{SUB} >$  is Boltzmann's constant and W is the number of microstates compatible with an energy E. The argument is based on the heat theorem which is the combined first and second laws of thermodynamics. It dates back to the work of Helmholtz and ...
