Answers to Problem 1: In order to solve this, we must reverse at least one equation and it turns out that the second one will require reversal. Here are both with the reversal to the second: N2(g)+O2 (g)(2NO(g) (H(= +180kJ. 2NO(g)+O2(g)(2NO2 (g) (H(= -112kJ. Notice that I have also changed the sign on the enthalpy from positive to negative.

In a previous unit, it was stated that all objects (regardless of their mass) free fall with the same acceleration - 9.8 m/s/s.This particular acceleration value is so important in physics that it has its own peculiar name - the acceleration of gravity - and its own peculiar symbol - g.But why do all objects free fall at the same rate of acceleration regardless of their mass?
