Background: Affymetrix high density oligonucleotide expression arrays are widely used across all fields of biological research for measuring genome-wide gene expression. An important step in processing oligonucleotide microarray data is to produce a single value for the gene expression level of an RNA transcript using one of a growing number of statistical methods.

### **Methods for evaluating gene expression from Affymetrix ...**

We made a thorough performance comparison of the three most recent human gene expression chips available from Affymetrix: Human Genome U133 Plus 2.0, Human Exon 1.0 ST and Human Gene 1.0 ST. First, we have compared reproducibility at the probe-, exon- (where possible) and gene-level using publicly available data on technical and biological replicates.

Processing Affymetrix Gene Expression Arrays Analyzing Affy microarrays with Bioconductor is "relatively" easy, particularly if all you want is to get the gene expression matrix. Once you have the gene expression values, much of the analysis techniques that can be used for RNA-Seq analysis can also be used for microarrays.

We designed and conducted a comparative study to answer the question whether gene expression data generated with Affymetrix U133A microarrays, four years past their expiration date, are useful and reliable. Figure 1 depicts the overview of the study, the experimental procedures, data used, and comparative analyses applied.
