AN INTRODUCTION TO ROBUST ESTIMATION 7 The solution to these approximate equations is  $p_2 = (X^T W X)^{-1} X^T W Y$ , where  $W$  is the diagonal matrix  $\text{diag}(w_1, \dots, w_n)$ . Of course, this provides us with a new start and new weights, which, in turn, requires recomputation of  $(X^T W X)$ . This iteration is continued until a reasonable degree of convergence is reached.

Robust Estimation Introduction. A common computational problem in vision is to estimate the parameters of a model from image data. Examples of parameterized models to be fit to image data include lines and ellipses, camera calibration models, image motion models, 3D planar regions, 3D models, and human face models. Key Difficulties:

Introduction. Robust statistics seek to provide methods that emulate popular statistical methods, but which are not unduly affected by outliers or other small departures from model assumptions. In statistics, classical estimation methods rely heavily on assumptions which are often not met in practice.
