The 2D-LC approach allows sensitive and global analysis of lipids, however, its setup is complex and the second dimension suffers from sample dilution effect. The first application of this method for lipidomics was in 2009 when a lab-made non-polar column was applied to the first column and a commercial normal phase column to the second.

Lipidomics

Lipidomics is a newly emerged discipline that studies cellular lipids on a large scale based on analytical chemistry principles and technological tools, particularly mass spectrometry. Recently, techniques have greatly advanced and novel applications of lipidomics in the biomedical sciences have emerged. This review provides a timely update on these aspects.
