The friction force opposes the motion and its direction is negative and this causes negative torque to be applied to the vehicle which leads to the clockwise rotation of the center of the mass as given by the expression of the torque. This clockwise rotation of the center of the mass causes the front of the car to pitch downward.

- The equations for rotational motion with constant angular acceleration have the same form as those for linear motion with constant acceleration.
- Torque is the product of force and lever arm.
- The rotational inertia depends not only on the mass of an object but also on the way its mass is distributed around the axis of rotation.

A moving object will have linear velocity, so it possesses translation kinetic energy and a rotating object will have angular velocity, so it possesses rotational kinetic energy. If an object rolls on a level surface without slipping, then it possesses linear velocity due to its translation motion and angular velocity due to its rolling motion.
