For long time, a table or a chart of nuclides was thought of a two-dimensional graph in which one axis represented the number of neutrons (N) and the other represented the number of protons (Z) in an atomic nucleus. Each point plotted on the graph thus represented the nuclide of a real or hypothetical chemical element (Fig. 1). The protons and neutrons are made up of 'up (u)' and 'down (d)' quarks.

A table of nuclides or chart of nuclides is a two-dimensional graph in which one axis represents the number of neutrons and the other represents the number of protons in an atomic nucleus. Each point plotted on the graph thus represents a nuclide of a known or hypothetical chemical element. This system of ordering nuclides can offer a greater insight into the characteristics of isotopes than the better-known periodic table, which shows only elements instead of each of their isotopes. The chart o
