OXYGEN UPTAKE KINETICS IN SPORT, EXERCISE AND MEDICINE

The characteristics of oxygen uptake (VO_2) kinetics differ with exercise intensity. When exercise is performed at a given work rate which is below lactate threshold (LT), VO_2 increases exponentially to a steady-state level. Neither the slope of the increase in VO_2 with respect to work rate nor the time constant of VO_2 responses has been found to be a function of work rate

The purpose of this study was to examine the oxygen uptake ($\dot{V}O_2$) kinetics and the energy systems' contribution at 97.5, 100 and 102.5% of the maximal lactate steady state (MLSS) swimming intensity. Ten elite female swimmers performed three-to-five 30 min submaximal constant swimming bouts at imposed paces for the determination of the swimming velocity (v) at 100%MLSS based on a 7 x 200 m intermittent incremental protocol until voluntary exhaustion to find the v associated at the ...

Pulmonary oxygen uptake (\dot{V}_{O_2}) kinetics, which describes the aerobic response to near instantaneous changes in metabolic demand, provides a valuable insight into the control and coordination of oxidative phosphorylation during exercise. Despite their applicability to the highly sporadic habitual physical activity and exercise patterns of children, relatively little is known regarding the influence of internal and external stimuli on the dynamic response.

In conclusion, oxygen uptake kinetics describes the processes that occur at the lung, in the blood and in the muscle to ultimately oxidize fuels into water and carbon dioxide. These systems are intimately linked together and it is the job of sports medicine scientists to
