Phacoemulsification Step By Step

Hydrodelineation may similarly be performed to separate the endonucleus from the epinucleus. The purpose is to leave the epinuclear shell to protect the posterior capsule during the first stages of phacoemulsification and removal of the endonucleus, but this step is often not performed and the entire nucleus is instead removed at once.

Step by step through phacoemulsification - The Cataract Course

Each step listed during phacoemulsification below needs to be performed skillfully, so that the next step becomes easier. The better performed each step, the less chance of complications during surgery. 1. Eye drops to dilate the pupil 2. Anesthesia - topical, subtenon, peribulbar, retrobulbar, or general 3.

Cataract Surgery - A Step by Step Guide to Phacoemulsification

Consistently successful phacoemulsification begins with preoperative planning. The key surgical steps are (1) anesthesia, (2) prepping, draping, and the microscope's setup, (3) the incision, (4) the capsulorhexis, (5) nuclear disassembly, (6) cortical cleanup, (7) implantation of the IOL, and (8) closure of the incision.
