Sheet Metal Design Guidelines

Sheet metal design guidelines are followed to design quality sheet metal enclosures. This helps in delivering the product at low cost and faster timelines. Following all sheet metal design guidelines is very difficult in the complex part. Therefore exceptions can be there for complex features design.

radii not be less than the thickness of the sheet (T). BENDS Minimum inside diameter on a hem should be 4X the thickness of the sheet. However, overall tolerances will depend on the radius, sheet thickness and any other features near the hem. HEMS Overall, all bend radii in o~sets should be 0.030".

Sheet metal parts with a minimum of 0.9mm to 20mm in thickness can be manufactured. Hole Diameter. When designing parts for laser cutting one should not make holes smaller than the thickness of the material. Bends. Bends in sheet metal are manufactured using sheet metal brakes. A +/- 1 degree tolerance on all bend angles.

Sheet Metal Design Guide - Geomiq

To manufacture sheet metal efficiently, reduce errors, and cut costs, you have to apply the engineering principle of design for manufacturing (DFM). DFM simplifies manufacturing sheet metal by considering design guidelines and tolerances that will ensure your component can actually be produced correctly.

CHECKLIST: Sheet Metal Design Guidelines & Tolerances

A sheet metal's ability to withstand stress in a flexure test is an essential facet of sheet metal design. Depending on the process adopted for bending, the K-factor in the area of bending is usually visualized. In the course of bending, the outer surface of the sheet metal witnesses more strain than the inner surface.

Critical Dimensions Sheet Metal Forming – Outside dimension should be used unless the inside dimension is critical. - 3 - Embosses and Offsets – Emboss and offset dimensions should be to the same side of the material unless the overall height is critical. Only the truly critical dimensions should be highlighted as such.

Design For Manufacturability – Sheet Metal Guidelines Bends For the ease of manufacturing, multiple bends on the same plane should occur in the same direction. Avoid large sheet metal parts with small bent flanges. In low carbon steel sheet metal, the minimum radius of a bend should be one-half the material thickness or 0.80 mm

It is recommended that: For tear drop hems, the inside diameter should be equal to the material thickness. For open hem the bend will lose its roundness when the inside diameter is greater than the sheet metal thickness. For bends, the minimum distance between the inside edge of the bend and the ...
