Mathieu functions, sometimes called angular Mathieu functions, are solutions of Mathieu's differential equation $y'' + (a - 2q \cos 2z)y = 0$, where a and q are parameters. They were first introduced by Émile Léonard Mathieu, who encountered them while studying vibrating elliptical drumheads. They have applications in many fields of the physical sciences, such as

Mathieu functions of period π or 2π , also called elliptic cylinder functions, were introduced in 1868 by Émile Mathieu together with so-called modified Mathieu functions, in order to help understand the vibrations of an elastic membrane set in a fixed elliptical hoop. These functions still occur frequently in applications today: our interest, for instance,
