Three Dimensional Compatible Finite Element A three-dimensional finite-element model is developed of the main Douglas-fir wood member, steel side plates, bolt, washers, and nut. The model accounts for friction, bolt clearance, progressive damage in the wood, nonlinear and inelastic behavior in the steel bolts and side plates, and

A three-dimensional (3-D) progressive failure algorithm is developed where the Layerwise Laminate Theory of Reddy [1] is used for kinematic description. The finite element model based on the layerwise theory predicts both inplane and interlaminar stresses with the same accuracy as that of a conventional 3-D finite element model.

Introduction to Finite Element Methods
A three-dimensional finite-element method is developed to calculate the impact pressure due to liquid sloshing in LNG tank. The finite-element method presented here is based on potential theory and Hamilton's principle. As a validation of the developed numerical scheme, the impact sloshing pressure is compared with experiments and

Results are presented from a numerical investigation of the effect of stacking sequence on energy release rate distribution in laminated carbon fibre reinforced epoxy double cantilever beam, single leg bending and end-notched flexure test specimens. The deformation behaviour of the specimens has been computed by three-dimensional nonlinear finite element analyses using a recently developed ...

Three-dimensional finite element models have been developed to study the effects of bolt-hole clearance on the mechanical behaviour of bolted composite (graphite/epoxy) joints. The joint type studied was single-bolt, single-lap, which is a standard test configuration in both a civilian and a military standard for composite joints.

The finite element method (FEM) is a powerful technique originally developed for numerical solution of complex problems in structural mechanics, and it remains the method of choice for complex systems.In the FEM, the structural system is modeled by a set of appropriate finite elements interconnected at discrete points called nodes. The three-dimensional (3D) elasto-plastic finite element method is used to study the structural behavior of the butt-type steel bolted joint. The numerical results are compared with AISC specification data. The similarity was found to be satisfactory despite the complication of stress and strain fields during the loading stages.
