Understanding Seismic Anisotropy In Exploration

The seismic records of these microseismic events are very rich in information, which includes: location (map coordinates, depth, time), waveform information (apparent energy, frequency, background noise, signal to noise ratio), and geomechanical information (local stress state, anisotropy, seismic source mechanism), etc. Microseismic data is acquired, processed, and mapped during a hydraulic ...

Abstract: The Hi-CLIMB seismic array is located in the central-western Tibetan Plateau. The H-κ-c method (Li JT et al., 2019) was applied to receiver function data on the Hi-CLIMB, which corrects the back-azimuthal variations in the arrival times of Ps and crustal multiples caused by crustal anisotropy and dipping interfaces before performing H-κ stacking.
